#### **Lab Cycle – I (Wine quality dataset)**

1. Download the dataset winequality-red.csv file( each column is separated by a semicolon (;)) from the UCI Machine Learning Repository.

```
import numpy as np
arr = np.loadtxt(r"C:\Users\Y20C179\Downloads\winequality-
red.csv",delimiter=";", dtype=str,skiprows=1)
display(arr)
```

#### Output:

2. Convert it to numPy array, name it as wines (leave the first row of the list) and specify the data type of array as float.

```
wines=arr.astype('float64')
print(wines)
```

```

```

3. Identify the shape of the array.

wines.shape

## Output:

```
(1599, 12)
```

4. Display the element at row 3 and column 4.

```
wines[2,3]
```

#### Output:

2.3

5. Display the first three items from the fourth column.

```
wines[:3,[3]]
```

## Output:

```
array([[1.9],
[2.6],
[2.3]])
```

6. Display third column from each row.

```
wines[:,2]
```

```
array([0., 0., 0.04, ..., 0.13, 0.12, 0.47])
```

7. Display fourth row.

```
wines[3]
```

## Output:

```
array([11.2 , 0.28 , 0.56 , 1.9 , 0.075, 17. , 60. , 0.998, 3.16 , 0.58 , 9.8 , 6. ])
```

8. Assign value 10 to 2nd row and 6th column element.

```
wines[1,5]=10
print(wines[1,5])
```

#### Output:

10.0

9. Take the 10th column from wines array and name that slice as slice\_new and assign value 666 to all elements of slice\_new.

```
slice_new=wines[:,9]
slice_new[:]=666
print(slice new)
```

```
[666. 666. 666. 666. 666. 666.]
```

## 10. Display wines array.

```
print(wines)
```

## Output:

```
[[ 7
          0 ... 666

6
      0
          0 ... 666 11
                        6]]
```

12. Add 10 points to each quality score.

```
wines[:,-1]+=10
print(wines[:,-1])
```

## Output:

```
[15 15 15 ... 16 15 16]
```

13. Find the sum of all the elements in an array

```
print(sum(sum(wines)))
print(wines.sum())
```

## Output:

1226388 1226388

14. Find the sum of all the values in every column.

```
print(wines.sum(axis=0))
```

## Output:

15. Find the sum of all the values in every row.

```
print(np.sum(wines, axis=1))
```

```
[746 779 771 ... 773 777 765]
```

16. Add the quality column to itself.

```
wines[:,-1]+=wines[:,-1]
wines[:,-1]
```

#### Output:

```
array([30, 30, 30, ..., 32, 30, 32])
```

17. Multiply alcohol by quality

```
print(wines[:,-2]* wines[:,-1])
```

#### Output:

```
[270 270 270 ... 352 300 352]
```

18. Display which wines have a quality rating higher than 5.

```
print(wines[wines[:,-1]>5])
```

#### Output:

```
[[11 0 0 ... 0 9 6]

[ 7 0 0 ... 0 10 7]

[ 7 0 0 ... 0 9 7]

...

[ 5 0 0 ... 0 11 6]

[ 6 0 0 ... 0 11 6]
```

19. Check if any wines have a quality rating equal to 10.

```
print (wines [wines [:, -1] == 10])
```

#### Output:

[]

## 20. Select rows in wines where the quality is over 7

```
print (wines [wines [:, -1] > 7])
```

#### Output:

```

22. Change the shape of wines array.

```
wines = wines.reshape((533,36))
print(wines.shape)
```

# Output:

(533, 36)

## <u>Lab Cycle – II (Iris dataset)</u>

#### 1. Print the dataset iris.

```
import pandas as pd
file = pd.read_csv("/content/IRIS.csv")
file
```

#### Output:

1	sepal_length	sepal_width	petal_length	petal_width	species
0	5.1	3.5	1.4	0.2	Iris-setosa
1	4.9	3.0	1.4	0.2	Iris-setosa
2	4.7	3.2	1.3	0.2	Iris-setosa
3	4.6	3.1	1.5	0.2	Iris-setosa
4	5.0	3.6	1.4	0.2	Iris-setosa
145	6.7	3.0	5.2	2.3	Iris-virginica
146	6.3	2.5	5.0	1.9	Iris-virginica
147	6.5	3.0	5.2	2.0	Iris-virginica
148	6.2	3.4	5.4	2.3	Iris-virginica
149	5.9	3.0	5.1	1.8	Iris-virginica

150 rows × 5 columns

#### 2. Print the structure of the dataset iris.

file.info()

#### Output:

150 non-null

dtypes: float64(4), object(1)

memory usage: 6.0+ KB

4 species

object

3. Print the summary of all the variables of the dataset iris.

file.describe()

## Output:

	sepal_length	sepal_width	petal_length	petal_width
count	150.000000	150.000000	150.000000	150.000000
mean	5.843333	3.054000	3.758667	1.198667
std	0.828066	0.433594	1.764420	0.763161

7. Find the total sales &profit of each product sold by the retailer.

```
file.groupby(['Retailer', 'Product'])[['Total Sales', 'Operating Profit
']].sum()
```

## Output:

## Total Sales Operating Profit

Retailer	Product		
Amazon	Men's Apparel	10474770.0	3331443.80
	Men's Athletic Footwear	12011959.0	4518030.11
	Men's Street Footwear	22161652.0	8707658.12
	Women's Apparel	15710639.0	6280071.53

8. Find the units sold, total sales &profit of the products sold between the dates 1/1/2020 and 4/15/2020.

```
file[(file['Invoice Date']>'1/1/2020') & (file['Invoice Date']<'4/15/20
20')][['Units Sold', 'Total Sales', 'Operating Profit']].sum()</pre>
```

#### Output:

```
Units Sold 137483.00
Total Sales 51549291.00
Operating Profit 17815082.37
dtype: float64
```

9. Find the no of units sold of each product by each retailer in every city.

```
file.groupby(['City', 'Retailer', 'Product'])['Units Sold'].sum()
```

## Output:

```
City Retailer Product
Albany Kohl's Men's Apparel 1375
Men's Athletic Footwear 1401
Men's Street Footwear 2104
Women's Apparel 1613
Women's Athletic Footwear 1311
```

10. Find the products with different price per unit in different cities with proper information.

```
list(df.groupby(['Product', 'City', 'Price per Unit']).groups.keys())
```

```
[("Men's Apparel", 'Albany', 49),

## <u>Lab Cycle – V (Movies Dataset)</u>

```
import pandas as pd
from datetime import datetime
file = pd.read_csv("movies.csv")
file = file[file["Release Date"].str.contains('TBD') == False]
file['Release Date'] = file['Release Date'].apply(pd.to_datetime)
file['Date']=file['Release Date'].dt.strftime('%d')
file['Month']=file['Release Date'].dt.strftime('%m')
file['Year']=file['Release Date'].dt.strftime('%Y')
```

1. (i). Find out the no of movies released in every month of the year 1995.

```
file[file['Year'] == '1995'][['Title', 'Month']].groupby('Month').count()
```

## Output:

(ii). Find out the no. of movies released in every year from 1990 to 1998.

```
file[(file['Year']>='1990') & (file['Year']<='1998')][['Title', 'Year']
].groupby('Year').count()</pre>
```

#### Output:

Title

Year

1990	28
1991	33
1992	28

2. (i). Find no. of movies released under each genre given in the database.

```
file[['Title', 'Major Genre']].dropna().groupby('Major Genre').count()
```

#### Output:

Title

# Major Genre

•	
Action	420
Adventure	274
Black Comedy	36
Comedy	675

(ii). Find the movies under each genre with 1MDB rating >7 and rotten tomatoes rating > 60.

```
list(file['IMDB Rating']>7) & (file['Rotten Tomatoes Rating']>60)
].dropna().groupby(['Major Genre', 'Title']).groups.keys())
```
